증례 (**or** 수술술기) : Fractures of distal humerus are one of the challenging injuries due to its complex anatomy and accompanied comminution. For dual plate fixation, orthogonal plating and parallel plating are widely used but which is the best way is debatable. The purpose of this study is to report good clinical results and early bone union of posterior-posterior plate fixation for distal humerus fracture.

acknowledgment :

Posterior-posterior plating, Distal humerus fracture
