증례 (or 수술술기) : Axial loading in low flexion angle is thought to be associated with noncontact anterior cruciate ligament (ACL) injury. The purposes of this study were to quantify the importance of axial loading in noncontact ACL injury and to find out the knee joint condition under the axial loading in ACL injured status.

acknowledgment : This study was supported by a grant from Seoul R&BD program (ST110036)

anterior cruciate ligament injury; axial loading; footprint distance; anterior cruciate ligament transaction
