증례 (**or** 수술술기) : Controversy has continued surrounding routine use of anticoagulants after total knee arthroplasty (TKA) for thromboprophylaxis to Asian patients. There is little information about the frequency of myocardial infarction and cerebral infarction causing by thromboembolism after TKA. The purpose of this study was to assess the incidence of thromboembolism related events and death after primary TKA in patients receiving enoxaparin and patients without thromboprophylaxis.

**acknowledgment :**

total knee arthroplasty, thromboembolism, enoxaparin
