증례 (**or** 수술술기) : Degenerative spondylolisthesis is rarely seen in the cervical spine and observed in old patients, who often require surgical treatment. There are a few publications regarding the patients who were managed by surgical treatment for degenerative spondylolisthesis of cervical spine. Arthrodeses were considered to be the appropriate treatment for it. However, there have been no reports regarding whether cervical degenerative spondylolisthesis progresses. Also, there is a debate whether the instability is combined with cervical spondylolisthesis. The purpose is to find out whether cervical degenerative degenerative spondylolisthesis and instability combined with spondylolisthesis progress.

acknowledgment :

Degenerative cervical spondylolisthesis, instability, progress
