증례 (**or** 수술술기) : Slipped capital femoral epiphysis (SCFE) usually develops at puberty, and rarely under 10 years. Fixation of the physis with screw(s) aiming at physeal closure to prevent further slippage, would cause significant leg length discrepancy (LLD) and is condemned to interfere with remodeling of the proximal femoral deformity. The purpose of this study is to analyze effects and complications of physis-sparing procedures in the management of SCFE under 10 years.

acknowledgment :

slipped capital femoral epiphysis, under 10 years
