증례 (**or** 수술술기) : Carpal fracture and dislocation represent a spectrum of bony and ligamentous damage, describing the resultant damage apparent on radiographs; overlap of the carpal rows, a dorsally displaced capitate and the lunate is in a relatively normal alignment with the forearm. Trans-scaphoid perilunate fracture-dislocation is resulted from the application of a body-weight force on an outstretched hand. Physical test and CT demonstrates details the type of fracture and dislocation. Conservative treatment by manual reduction to prevent the neurovascular compromise is performed and if a reduction is not maintained, open reduction and fixation is indicated.
